ε, Double, 3.4 and 9.5, brilliant white and cerulean blue.

Mebsuta is from Al Mabsuțăt, the Outstretched, from its marking the extended paw of the early Arabic Lion, but now it is on the hem of Castor's tunic. Burritt had it Melucta in his Geography, and Mebusta in his Atlas; Professor Young, following English globes, has Meboula; and elsewhere we find Menita, Mesoula, and Mibwala.

 ε , δ , λ , and others near by, were the Chinese **Tung Tsing**.

ζ, Variable, 3.7 to 4.5, pale topaz.

Mekbuda is from **Al Makbūdah**, Contracted, the Arabic designation for the drawn-in paw of the ancient Asad; but some, with less probability, derive it from **Al Mutakabbidah**, a Culminating Star.

Its variations, discovered by J. F. Julius Schmidt at Athens in 1847, have a period of about ten days, but Chandler says that definitive investigations are not completed. Lockyer thinks it also a spectroscopic binary.

η , Binary and variable, 3.2 to 3.7, and 9.

Propus is from the $\Pi\rho\delta\pi\sigma\nu\varsigma$ of Hipparchos and Ptolemy, indicating its position in front of Castor's left foot, and is its universal title, with the equivalent **Pracpes**. Riccioli wrote it $\Pi\rho\delta\pi\sigma\varsigma$, and Flamsteed gave both $\Pi\rho\delta\pi\sigma\iota\varsigma$ and **Propus**; but Tycho had applied this last to the star Fl. 1 among the *extras* of Gemini. This position of η similarly made it the **Pish Pai** of the Persians.

Bassus and Hyginus said **Tropus**, Turn, referring to the apparent turning-point of the sun's course at the summer solstice, which now is more precisely marked by the star y just eastward from η ; and Flamsteed also had $T\rho\delta\eta\sigma_{C}$.

Flammarion's assertion that Hipparchos knew η as a distinct constellation, **Propus**, does not seem well founded.

Tejat prior is from Al Taḥāyī, an anatomical term of Arabia by which it was known in early days; a name also applied to stars in the head of Orion. The Arabs included it with γ and μ in their Nuḥātai; the Chinese knew it as Yuē, a Battle-ax; and in Babylonia it marked the 8th ecliptic constellation, Maru-sha-pu-u-mash-mashu, the Front of the Mouth of the Twins.

It portended lives of eminence to all born under its influence.

The variability of η was discovered by Schmidt in 1865, and its period is now considered as 229-231 days; in 1881 Burnham found it double, the components 1".08 apart, and likely to prove an interesting binary system.
